VC'S FOREWORD

*Message from
the Vice Chancellor,*

I am Pleased to know that the Medical Simulation Centre, MGMCRI plans to bring out second version of simplified manual on CPR, based on AHA 2015 recommendations. Medical Simulation Centre has been conducting AHA approved courses on BLS, ACLS and PALS, training hundreds of health care providers from different backgrounds . The centre has realized the need for a simplified CPR manual with flow charts, algorithms that are easily understandable which helps in rapid decision making .

The new version incorporated drugs used during resuscitation . The team of Medical Simulation Centre deserves appreciation for bringing up this second version.

Prof. Subhash Chandra Parija

Foreword

Message from the Director Simulation Centre,

Basic Life Support and Advanced Cardiac Life support are today's essential skills for all doctors. This training helps to tackle immediate life threats and saves countless lives worldwide. The MSC, MGMCRI is proud to be one of the International Training Centres for these courses in India. This in house manual edited by Prof. HemanthKumar VR. HOD of Anaesthesia, ITC Coordinator is a simplified algorithmic approach to a very confusing subject and I am sure it will be immensely helpful for all participants in these courses. I commend the entire authorship of this booklet for an excellent job.

Assessing Response

- * Tap: on the shoulder
- * Shout: sir, are you okay?

(Call for help) Activating Emergency Response System

- * Shout for help
- * Call 108 & ask for AED

Check pulse and breathing

- * Simultaneously Scan the chest movement for breathing & check carotid pulse (in the groove between trachea & sternocleidomastoid muscle) atleast 5sec & not more than 10 sec

Hand Position

- * Heel of the palm of one hand on the center of lower half of sternum (i.e) center of two nipples
- * Support with other hand

Performing CPR

- * Wrist, elbows, shoulders in a straight line
- * Movement should come from hip joint

Breath using a pocket mask

- * Keep the pocket mask over the face tightly
- * Do head tilt & chin lift if no suspected neck injury
- * Give 2 breaths (1 breath over 1 sec)
- * Do not hyperventilate
- * Watch for chest rise

2 Rescuer CPR with Bag mask ventilation

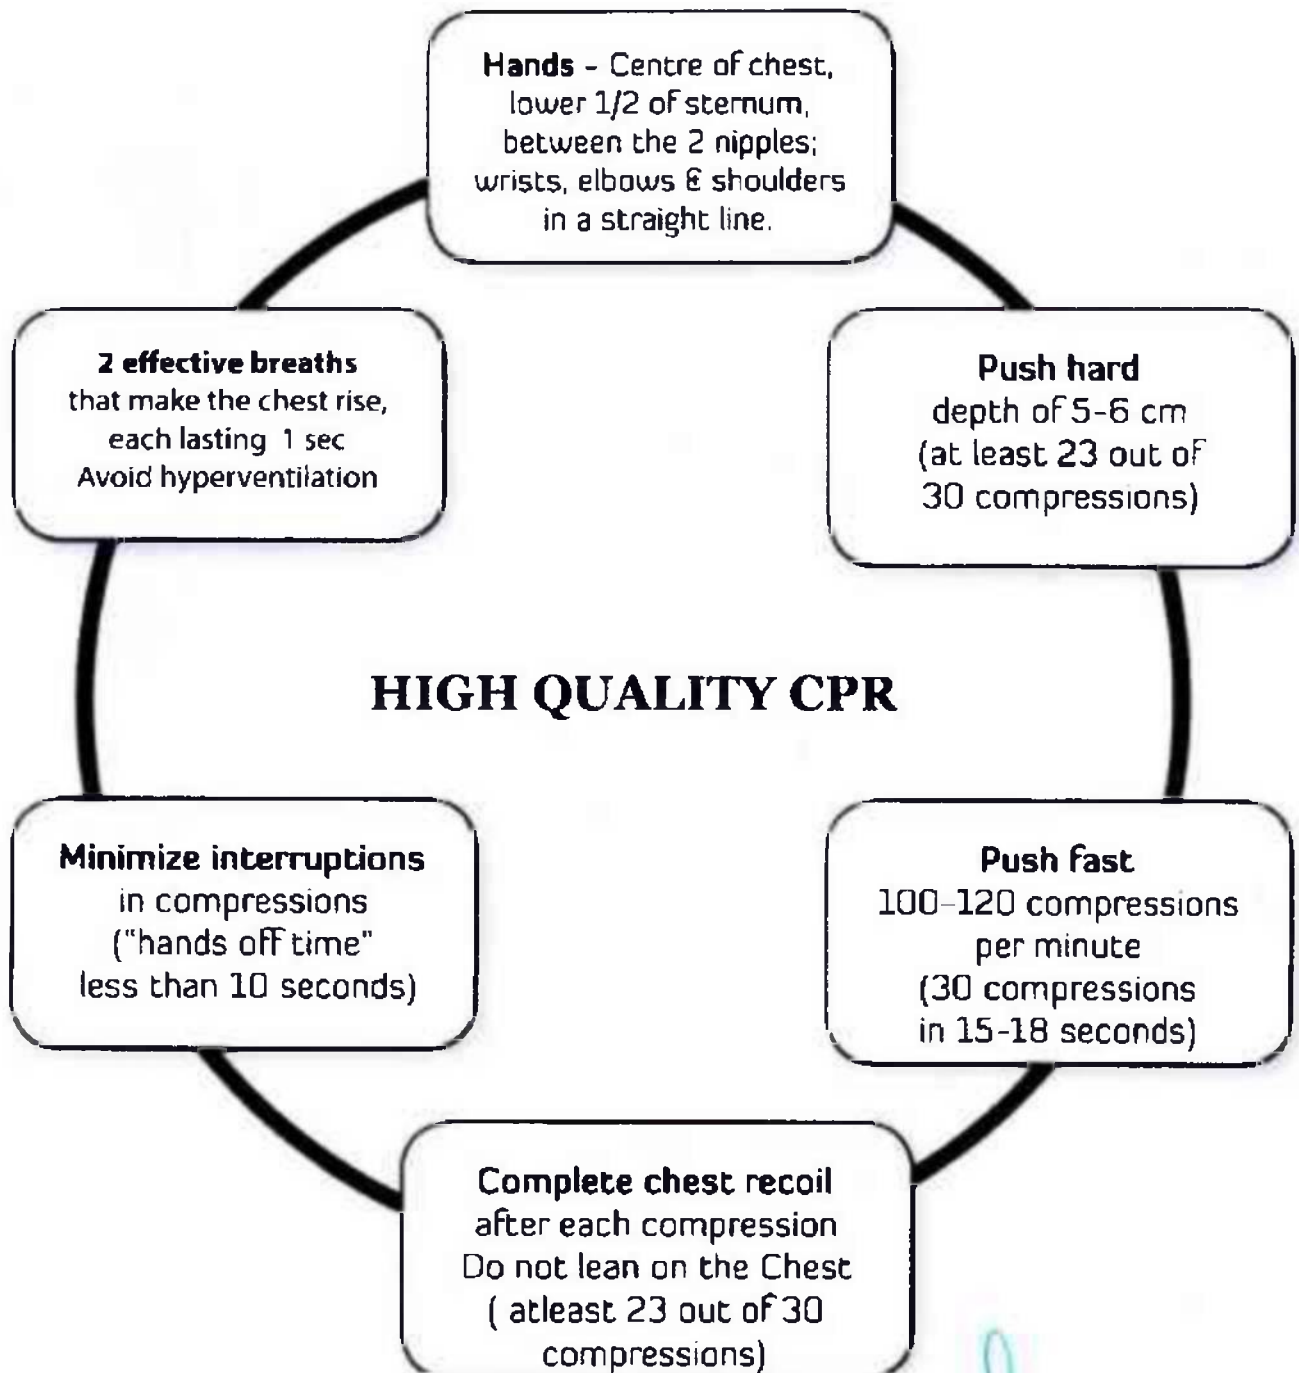

- * 1st rescuer gives 30 compression
- * 2nd rescuer positioned at head end of victim & gives 2 breaths using bag mask ("C & E" technique to hold the mask, head tilt & chin lift)
- * 1 breath over 1 sec
- * Do not hyperventilate
- * Watch for chest rise

AED Algorithm

AUTOMATED EXTERNAL DEFIBRILLATOR

REGISTRAR
SRI BALAJI VIDYAPEETH
(Deemed University under UGC ACT, 1956)
Accredited by NMAC with 'A' Grade
Pillaiyarkuppam, Pondicherry-607 402.

Use of AED on infants

1. A manual defibrillator is preferred
2. If not available, an AED with a paediatric dose attenuator is preferred.
3. Use an AED without a paediatric dose attenuator if neither is available.

Use of AED pads in children less than 8 years of age

1. An AED with child pads.
2. If child pads are not available, use adult pads (but not touching each other).

1. Switching on AED

Rationale:

**To listen & Follow the
AED prompts**

REGISTRAR
SRI BALAJI VIDYAPEETH
(Deemed University under 3 of UGC ACT, 1956)
Accredited by ISCA with 'A' Grade
Pillaiyarkuppam, Pondicherry-607 402.

2.a. Applying AED pads to patient's chest

Rationale:

To analyse the rhythm.

*Attach the apex pad
just below the left
nipple

*Attach the sternal pad
just below the right
clavicle

2.b. Plugging in pads connector to AED

Rationale:

This step should not be
done before attaching
the pads since AED
will start analyse the
rhythm even if the pads
are in the air

2.c. Clearing the patient before rhythm analysis

Rationale:
To avoid
misinterpretation of
rhythm by the AED

3. Delivery of shock

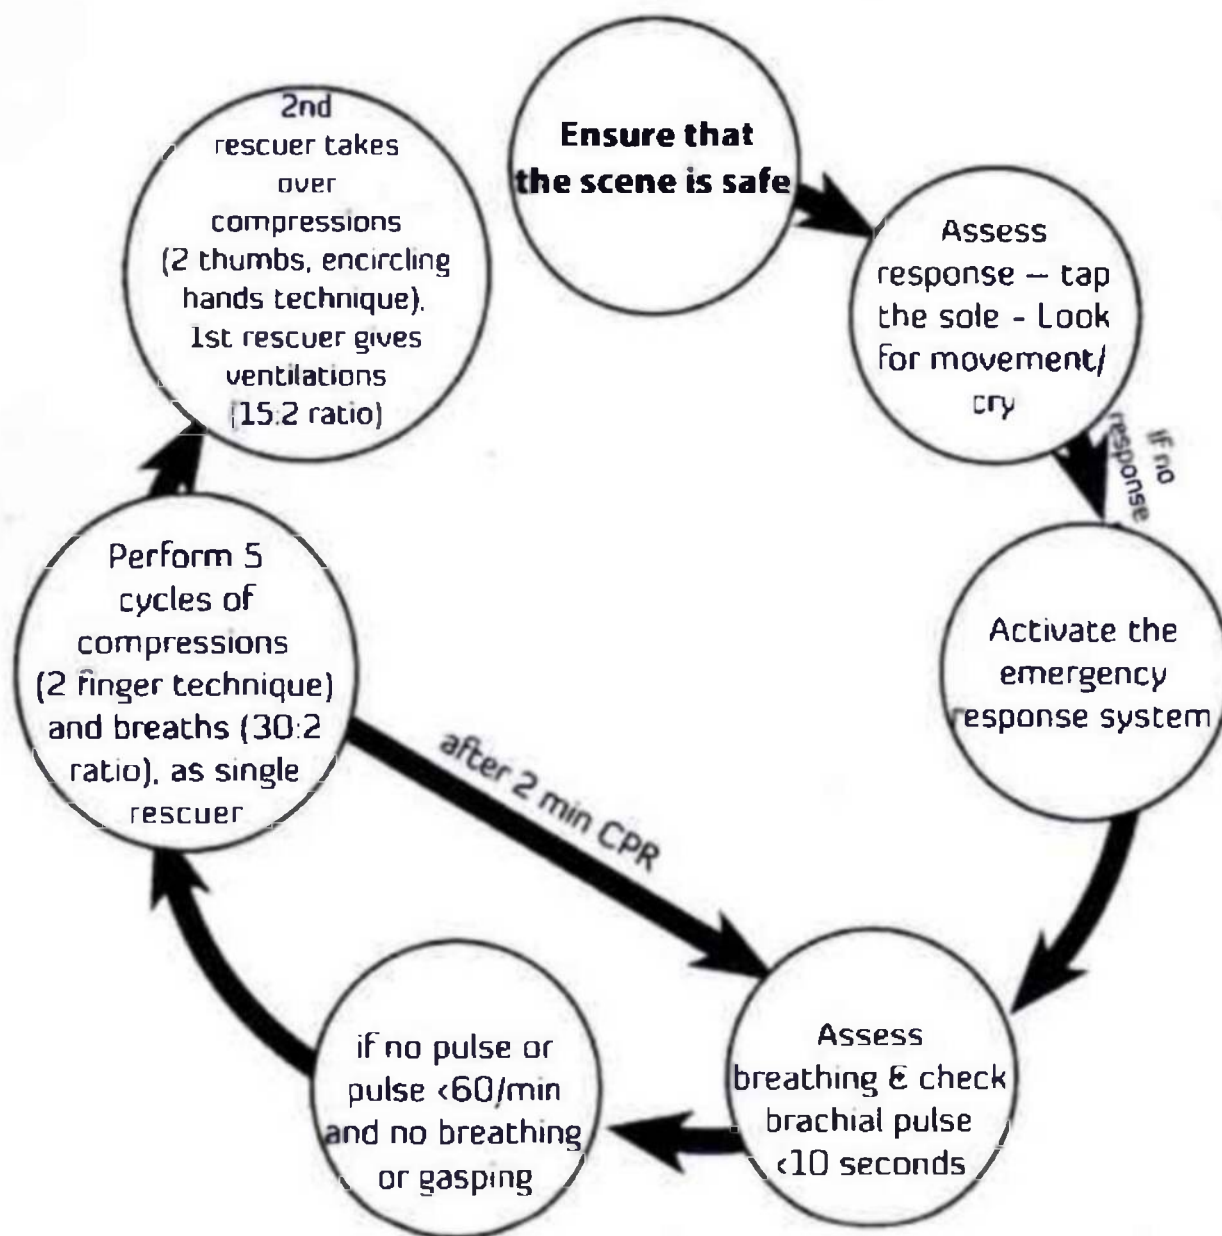

Rationale:
Press the shock button
manually after ensuring
that no one is touching
the victim

Checking response

- * Tap: on the sole
- * Shout : hey Papa..

Activating Emergency Response System (Calling for help)

- * Shout for help
- * Call 108 & ask for AED

Pulse and breathing

Simultaneously
Scan the chest
movement
and check brachial
pulse by gently
compressing the
brachial artery
with the pulp of
3 or 4 fingers in
the inner aspect
of arm, midway
between shoulder
& elbow, at least for
5 sec
and not more than
10 sec.

2 finger technique

- * 2 fingers
perpendicular to the
center of the lower
half of sternum
(center of 2 nipples)
- * 30 compressions
with the depth of one
and half inches or
4cm
- * Allow complete
chest recoil after
each compression

Using a pocket mask

- * Keep the pocket mask over the face tightly
- * Head should be in the neutral position
- * Do not hyper extend the neck
- * Give 2 breaths (1 breath over 1 sec)
- * Do not hyperventilate
- * Watch for chest rise

Two thumbs hands encircling technique(2 Rescuer CPR)

- * 1 rescuer: positioned at foot end of infant
- * 2 thumb hand encircling technique
- * 15 compression
- * 2 rescuer: positioned at head end of infant
- * Using bag mask ("C & E technique" to hold the mask)
- * Give 2 breaths (1 breath over 1 sec)
- * Do not hyperventilate
- * Watch for chest rise

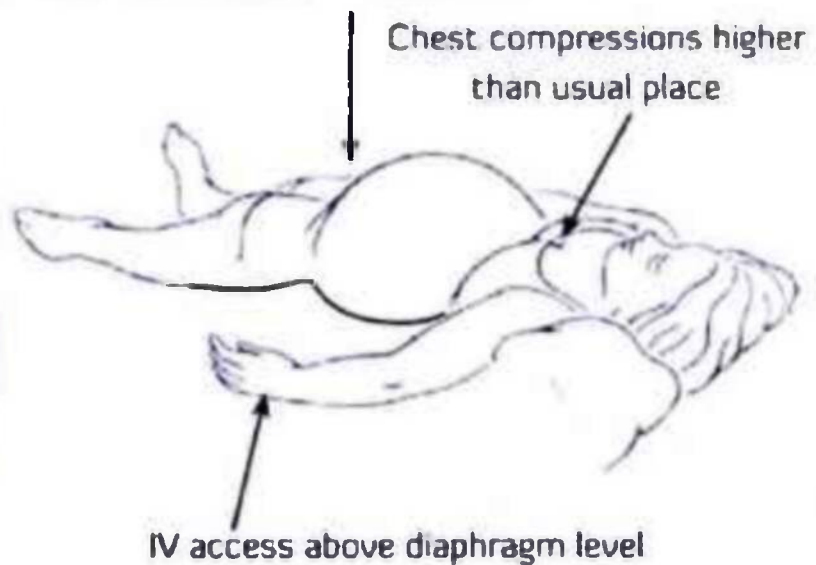

Pregnancy and CPR

- Follow BLS and ACLS guidelines
- Modified Position - do manual uterine displacement.
- Chest compressions should be performed slightly higher on the sternum than normally recommended to adjust for elevation of diaphragm
- Intravenous access to be secured above diaphragm level
- If no Return Of Spontaneous Circulation by 4 min perform emergency caesarean section
- Aim for delivery within 5 min of onset of resuscitation
- Continue resuscitative efforts during and after caesarean section

Caesarean section if no ROSC < 4 min

Summary of High Quality BLS

Component		Adults	Children	Infants (age<1 yr)
Scene safety		Ensure "Scene is safe"		
Check Response		Tap and Shout, "Are you all right?" Look for movement / speech		Flick the soles of the feet & look for movement / cry
Call for Help		Activate Emergency Response System; Get AED		
Check Pulse & Breathing Simultaneously		Check pulse and observe for chest rise (>5 sec but <10 sec)		
		Carotid pulse		Brachial pulse
Hand placement for compressions		Two hands – centre of chest; lower ½ of sternum (between the 2 nipples)	As in adult. One hand alone may be used for small children	Two finger technique (If one rescuer)
				Two thumb-encircling hands technique (If 2 rescuers)
Compression rate		100-120 per min		
Compression depth		At least 5 cm	At least 1/3rd the AP diameter of chest	
			About 5 cm	About 4 cm
Compression / ventilation ratio	Without advanced airway	30:2 for one or two rescuers		30:2 if one rescuer 15:2 if two rescuers
	With advanced airway	Continuous compressions @ 100-120 per min 1 breath every 6 seconds		

REGISTRAR

Chest recoil		Allow full re-expansion of chest before next compression	
Minimize interruptions		All interruptions should be <10 seconds (hands off time <10 sec)	
Opening the airway	No suspicion of cervical spine injury	Head tilt-chin lift	
	Suspicion of cervical spine injury	Maximize extension of neck	Avoid hyperextension
Device for giving artificial breaths	1 rescuer	Mouth-to-mask / Mouth-to-mouth	
	2 rescuer	Bag-mask device	
Breaths during respiratory arrest		1 breath every 5-6 seconds	1 breath every 3-5 seconds

Activation of Emergency Response System

Adults — If you are alone with no mobile phone, leave the victim to activate the emergency response system and get the AED before beginning CPR. Otherwise, send someone and begin CPR immediately. Use the AED as soon as it is available.

Children & Infants

Witnessed collapse — If you are alone with no mobile phone, leave the victim to activate the emergency response system and get the AED before beginning CPR. Otherwise, send someone and begin CPR immediately. Use the AED as soon as it is available.

Unwitnessed collapse — Give 2 minutes of CPR. Then Leave the victim to activate the emergency response system and get the AED. Return to the child or infant and resume CPR. Use the AED as soon as it is available.

Megacode Resuscitation Team Concept

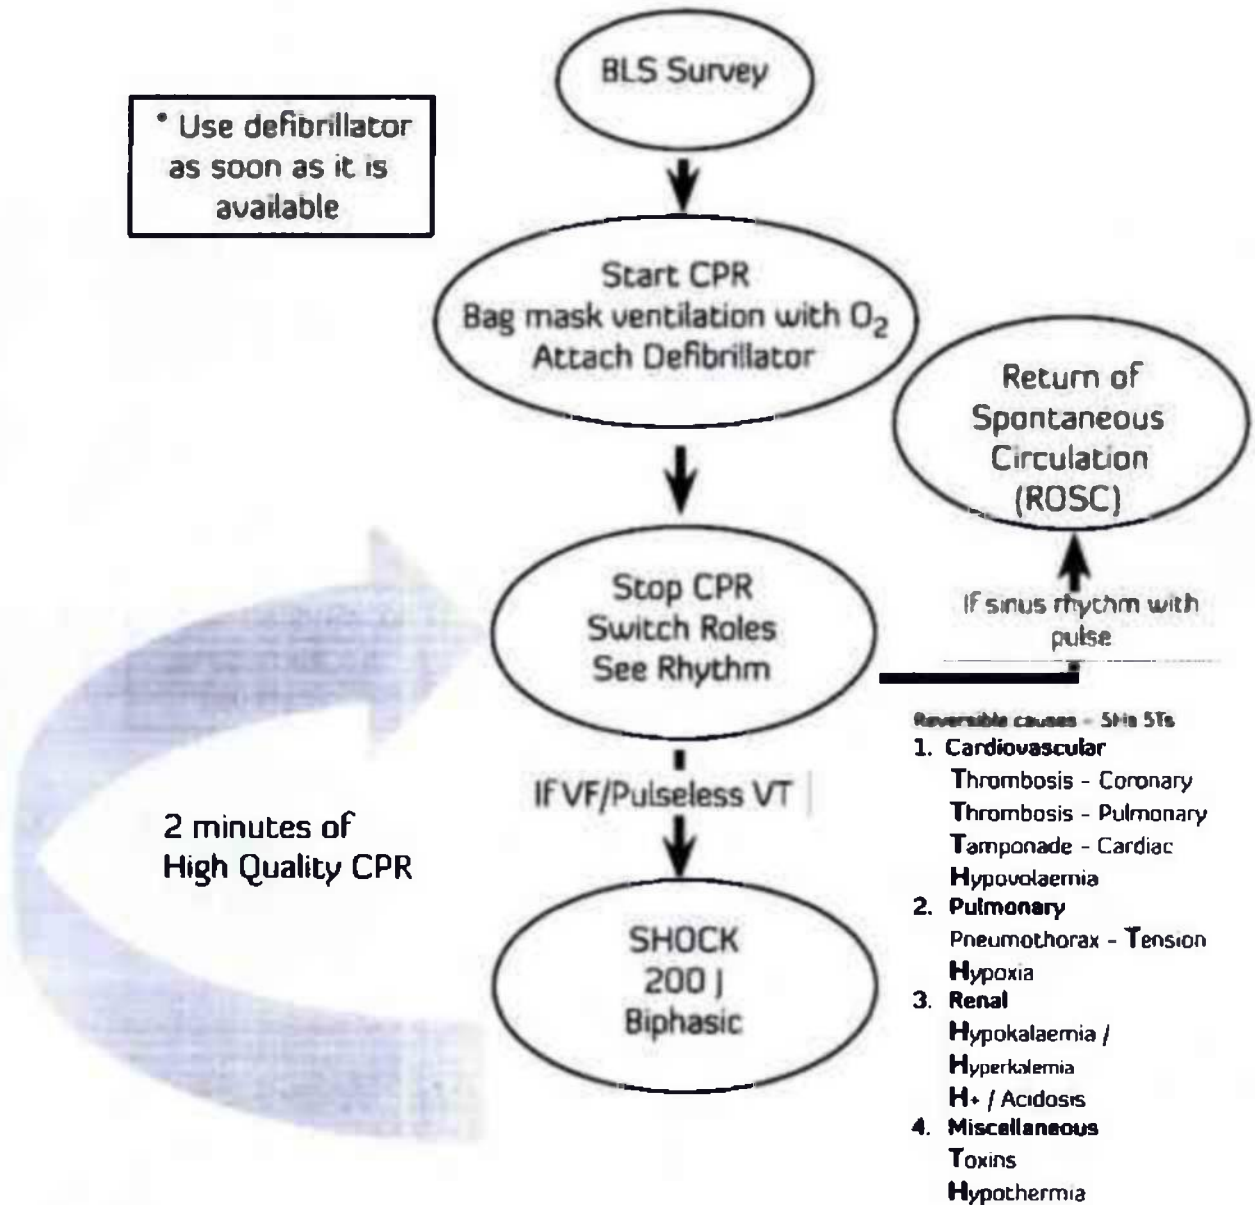

Effective resuscitation requires coordination between the team leader and team members. The coordination is discussed in the following 8 principles.

Principles of team resuscitation

No.	Principle	Example
1	Closed-loop communication	Leader – "Now that we have a shockable rhythm (VF) on the monitor, give 200 J biphasic shock." Member – After delivering the shock, says, "200 J biphasic shock delivered."
2	Clear messages	The leader instead of just saying "Give shock" should say, "Give 200 J biphasic shock."
3	Clear roles and responsibilities	The leader assigns clearly the following roles to team members – Compression, Ventilation, Monitor & Defibrillation, IV Access and drugs, Code Recorder.
4	Knowing one's limitations	If a team member assigned for defibrillation does not know how to use the defibrillator, the team leader assigns the role to a member who is capable of using the defibrillator.
5	Knowledge sharing	Team leader tells team member to apply conductive gel properly and apply sufficient pressure with the paddles on the chest before delivering shocks
6	Constructive intervention	If a team member fails to synchronize the defibrillator for a patient requiring cardioversion, another team member intervenes and reminds about synchronization.
7	Reevaluation and summarizing	The patient continues to have persistent VF, and we have now given 3 shocks, one dose of Epinephrine and Amiodarone each.
8	Mutual respect	The team leader gives commands with respect to team members, without shouting or criticism.

Cardiac arrest – VF/VT (Algorithm)

After 1st shock – Ensure iv/io access

After 2nd shock – Epinephrine 1 mg iv bolus, consider advanced airway

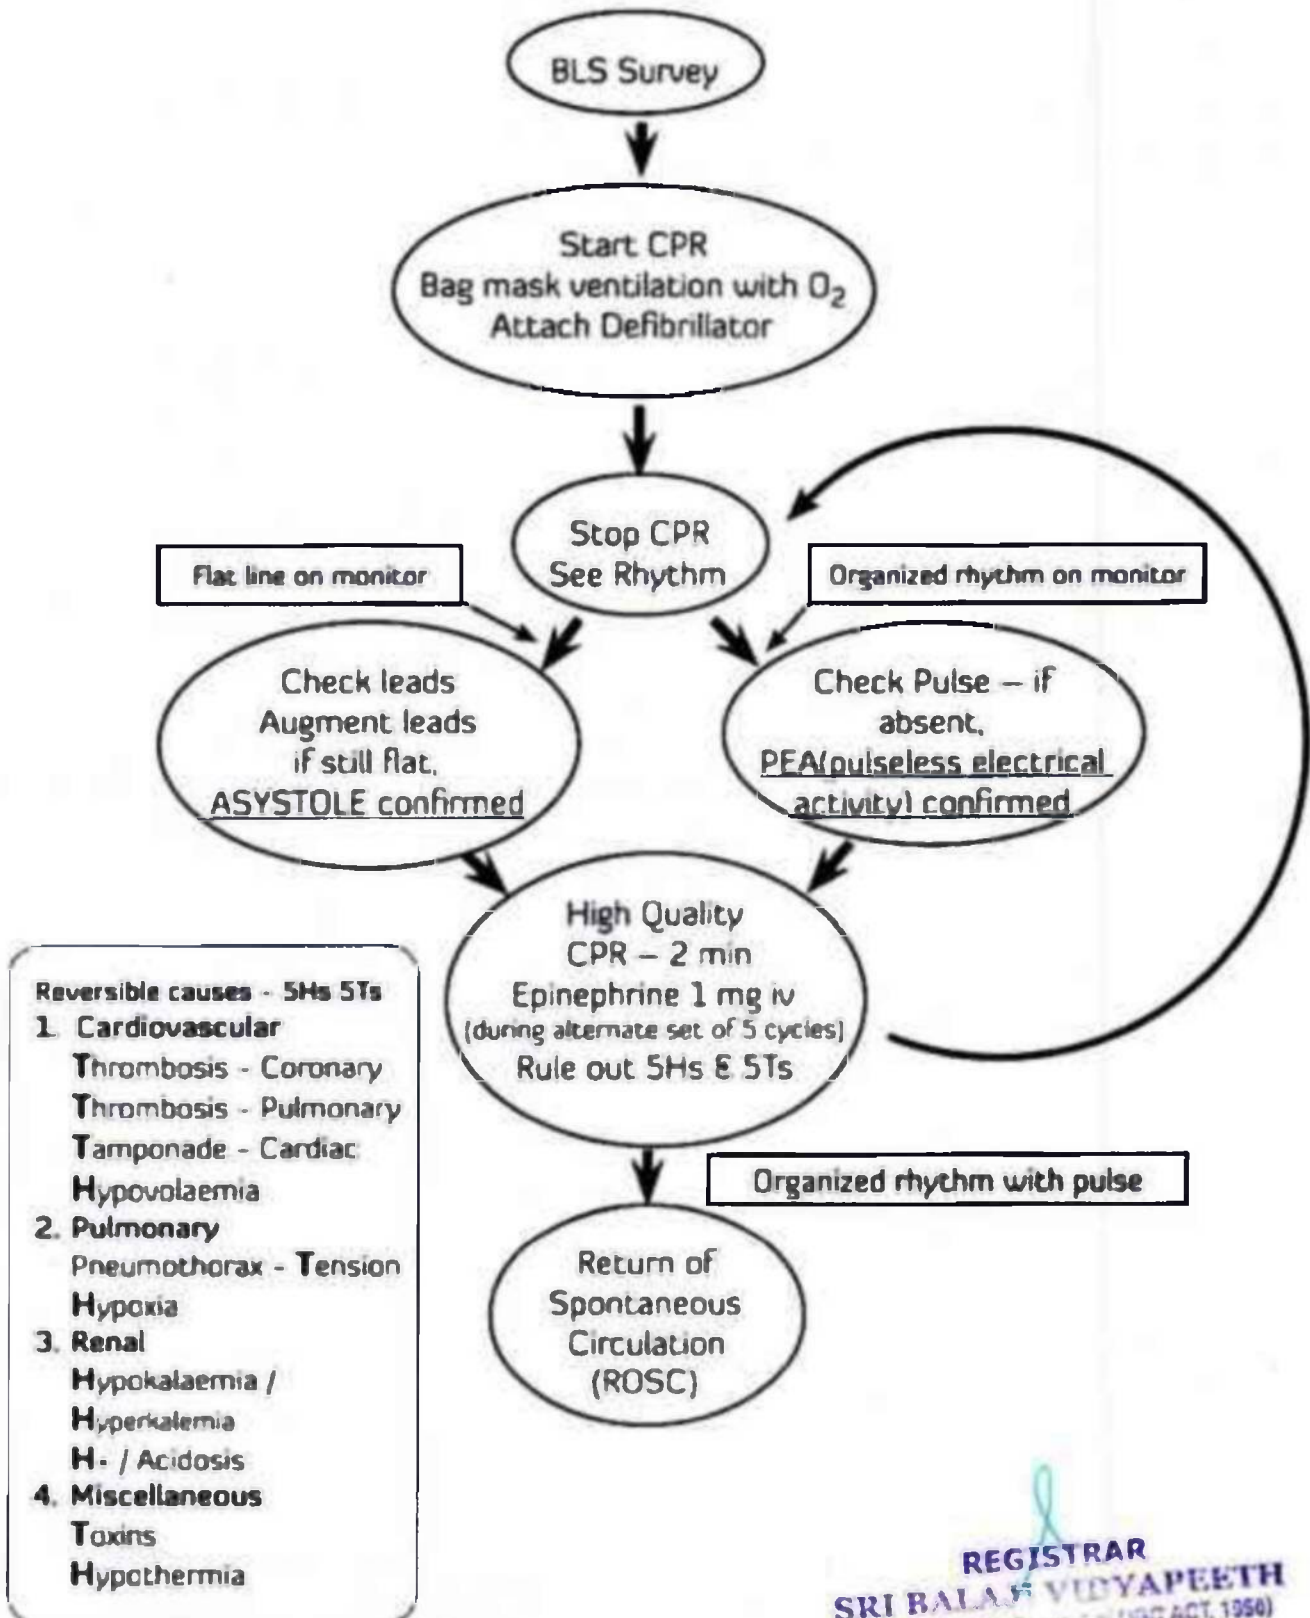

After 3rd shock – Amiodarone 300 mg iv, Treat reversible causes – 5Hs 5Ts

After 4th shock – Repeat Epinephrine 1 mg iv after every even shock

After 5th shock – Amiodarone 150 mg iv, second dose

Cardiac Arrest – Asystole / PEA Algorithm

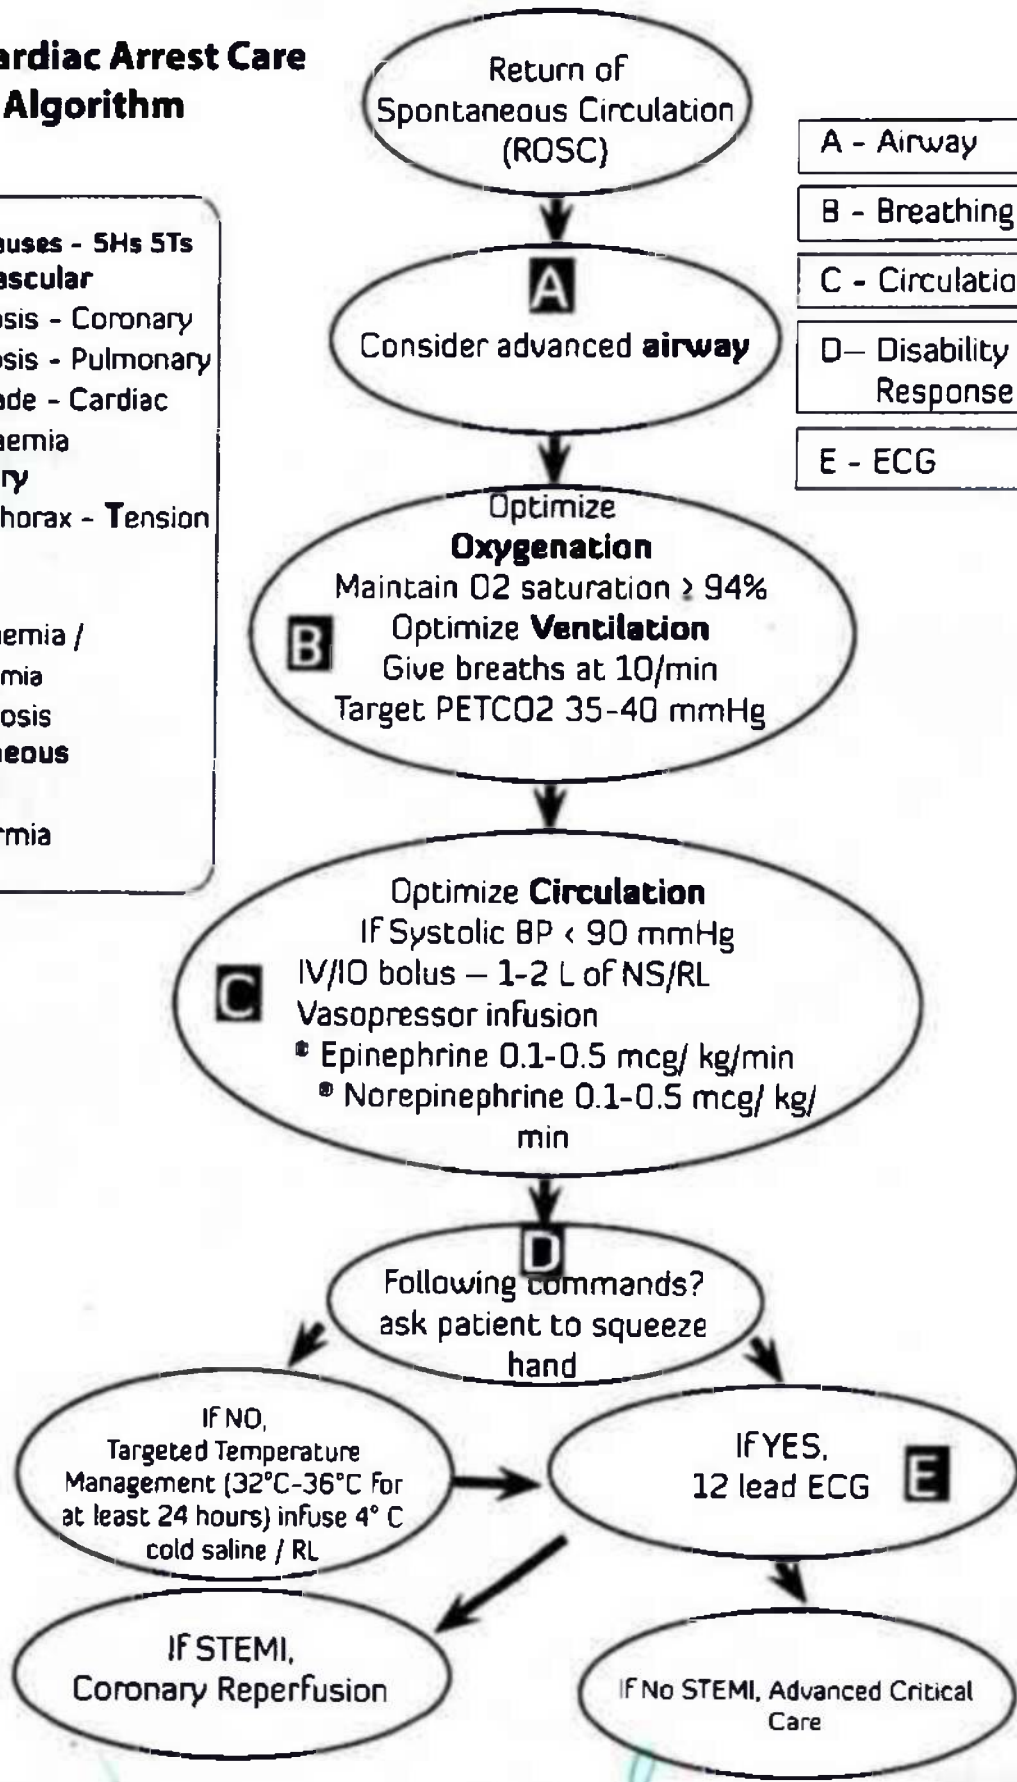

Post Cardiac Arrest Care Algorithm

- Reversible causes - 5Hs 5Ts
- 1. Cardiovascular**
Thrombosis - Coronary
Thrombosis - Pulmonary
Tamponade - Cardiac
Hypovolaemia
 - 2. Pulmonary**
Pneumothorax - Tension
Hypoxia
 - 3. Renal**
Hypokalaemia /
Hyperkalemia
H⁺ / Acidosis
 - 4. Miscellaneous**
Toxins
Hypothermia

- A - Airway
- B - Breathing
- C - Circulation
- D - Disability / Response
- E - ECG

Peri-arrest Management

Responsive patients (AB VOMIT)

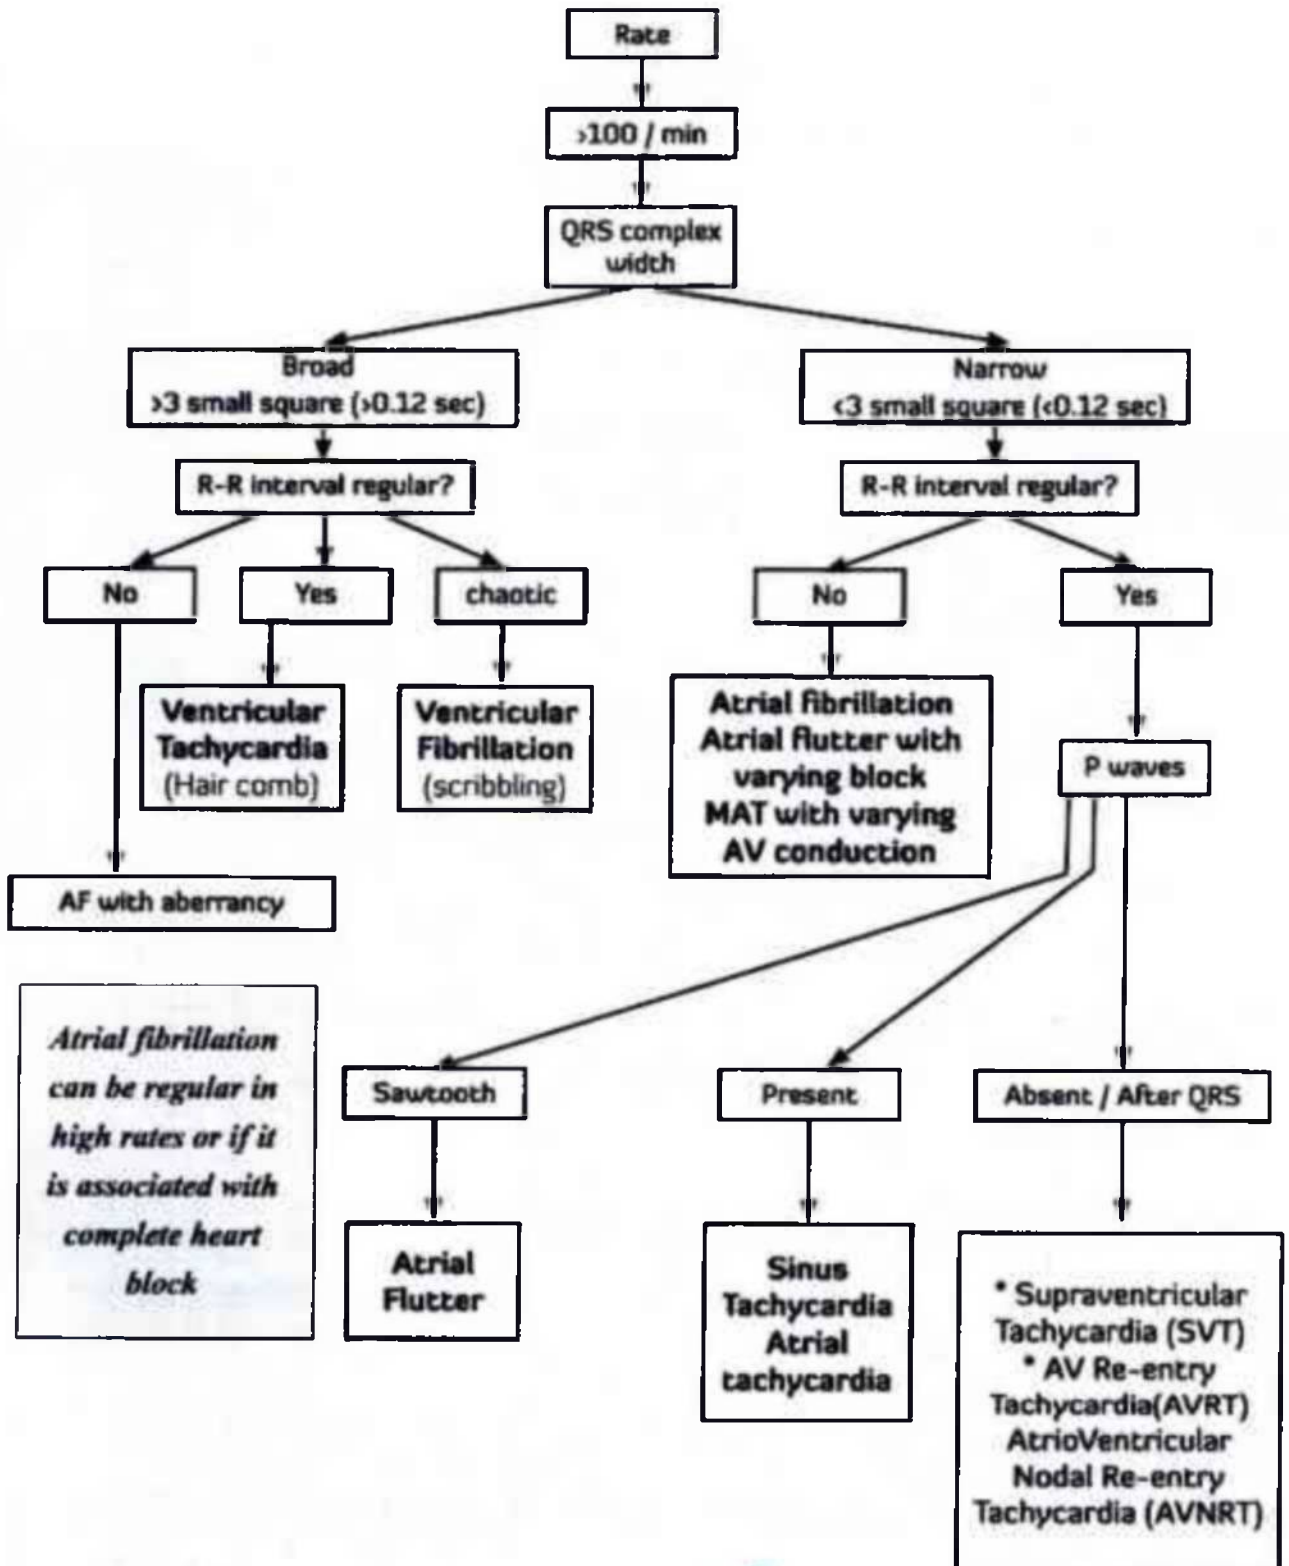

1. Airway - Ensure it is patent
2. Breathing - Ensure rate & pattern is normal
3. Vitals
4. O₂
5. Monitor - See rate & rhythm
6. IV Access
7. Treat as below after considering heart rate, ECG rhythm & blood pressure.

	Systolic BP > 90 mmHg	Systolic BP < 90 mmHg
Heart Rate < 50/min	Observe and monitor	Atropine 0.5 mg iv, every 3-5 minutes, maximum 3 mg (cumulative) ↓ (If no response) Transcutaneous Pacing) ↓ (If not available or not effective) Dopamine infusion 2-10 mcg/kg/min (or) Epinephrine infusion 2-10 mcg/min
Heart Rate > 150/min	12 Lead ECG Regular, Narrow QRS <ol style="list-style-type: none"> 1. Vagal manoeuvres 2. Adenosine 6 mg IV, repeat with 12 mg 3. Beta blockers / Calcium channel blockers 4. Expert consultation Irregular, Narrow QRS <ol style="list-style-type: none"> 1. Beta blockers / Calcium channel blockers 2. Expert consultation Broad QRS <ol style="list-style-type: none"> 1. Adenosine 6 mg IV, if regular and monomorphic (re-entry SVT) 2. Amiodarone 150 mg slow IV over 10 minutes 3. Expert consultation 	Synchronized cardioversion <ul style="list-style-type: none"> • Sedate (IV Midazolam 1-2 mg) / Fentanyl 50-100mg • Synchronize defibrillator • Select energy (according to rhythm) (Initial recommended energy doses in biphasic current) <ul style="list-style-type: none"> • Atrial Flutter & SVT: 50-100 J • VT: 100 J • Atrial Fibrillation: 120 J

* NIH Stroke Scale – National Institute of Health Stroke Scale

Electrical therapies used in ACLS

- 1) Defibrillation (Unsyncronized shock)
- 2) Synchronized Cardioversion
- 3) Transcutaneous Pacing

Defibrillation

Indication: Cardiac arrest patient with VF / Pulseless VT on monitor
VF/Pulseless VT on monitor

Energy used:

120-200 J Biphasic current (based on manufacturer recommendations; if not known, then use 200 J) 360 J Monophasic.

Steps:

- 1) Select energy
- 2) Apply conductive gel on paddle placement sites
- 3) Place paddles on the patient's chest - sternal paddle below the right clavicle, apex paddle on the left 5th intercostal space on the midaxillary line
- 4) Charge the defibrillator (pressing the charge button under the right thumb on the apex paddle)
- 5) Clear the patient by warning loudly - "Shocking - everybody stay clear"
- 6) Apply pressure (enough to cause mild indentation) on the chest and press shock buttons on both paddles simultaneously.
- 7) Resume chest compressions immediately (do not delay by checking for pulse or analyzing rhythm)

Transthoracic impedance:

For shock energy to be delivered maximally to the heart, transthoracic impedance has to be kept to a minimum. This can be done by

- 1) Using conductive gel - ensures maximum energy is delivered to the myocardium by decreasing impedance, ensures better contact between the paddles and chest wall.
- 2) Pressing the paddles and ensuring adequate contact with chest wall - until the indicator on the sternal paddle goes green (red and yellow indicate insufficient contact)
- 3) Pressing the paddles until there is indentation of the chest wall

Defibrillator safety:

- 1) Avoid O₂ flowing across the chest by avoiding giving ventilations during defibrillator use.
- 2) Charge the defibrillator only after the paddles are placed on the chest,
- 3) Avoid holding the defibrillator paddles in your hands for long
- 4) Warn loudly - "Shocking, everybody stay clear!" and checking visually before delivering shock
- 5) Put the paddles back on the defibrillator immediately after the shock is delivered
- 6) Do not hold both paddles on one hand

Synchronized cardioversion

Indications:

A patient with tachycardia and haemodynamically unstable (hypotension, and signs and symptoms of poor perfusion)

Initial energy doses recommended

Differs according to the rhythm on the monitor

- 1) Atrial flutter and Supraventricular tachycardia - 50 to 100 J Biphasic
- 2) Ventricular tachycardia - 100 J
- 3) Atrial fibrillation - 120 J and above If the rhythm does not convert, increase energy levels for subsequent shocks.

Steps:

- 1) Sedate the patient - IV Midazolam 1 to 2 mg / Fentanyl 50-100 mcg
- 2) Select energy dose according to the rhythms mentioned above
- 3) Set the defibrillator to "Synchronization" mode - this is confirmed by "Sync" display on the monitor, and by dots or dashes identifying R waves
- 4) Apply gel
- 5) Place paddles
- 6) Charge the defibrillator
- 7) Clear the patient
- 8) Shock - since the shock is delivered only at the next synchronization (with R wave), you may need to hold the paddles a little longer to confirm that shock has been delivered

Transcutaneous pacing

Indications - A patient with bradycardia and showing symptoms and signs of poor perfusion (including hypotension)

Steps:

- 1) Sedate the patient
- 2) Apply adhesive pacing pads on the patient's chest
- 3) Set the defibrillator to pacing mode
- 4) Select the desired pacing heart rate (80/min or above)
- 5) Increase the pacing current by 5 mAmp at a time while watching the monitor for the pacing impulses to appear (pacing current spike followed by broad QRS complex at the set heart rate) - electrical capture
- 6) After the impulses appear, increase the current by another 5-10 mAmp as a safety margin above the threshold
Check the vitals - pulse rate should match the set pacing rate (mechanical capture), BP should recover

	SYNCHRONIZED CARIOVERSION	DEFIBRILLATION
DEFINITION	"CARDIOVERSION" is the application of electricity to terminate a <i>still perfusing rhythm</i> (e.g., ventricular tachycardia with a pulse, supraventricular tachycardias including atrial arrhythmias) to restore the normal Sinus Rhythm	"DEFIBRILLATION" is the application of electricity to terminate a <i>non perfusing rhythm</i> (Pulseless ventricular tachycardia, Ventricular Fibrillation) to restore the normal sinus Rhythm.
MECHANISM OF ACTION	By depolarising all excitable tissue of the circuit and making the tissue refractory, the circuit is no longer able to propagate or sustain re-entry.	By depolarising a critical mass of the heart muscle, terminates the arrhythmia, and allows normal sinus rhythm to be re-established by the body's natural pacemaker, in the sino-atrial node of the heart.
LEVEL OF CONSCIOUSNESS	Conscious	Unconscious
SYNCHRONICITY	Synchronous By pressing the "SYNC" soft key, the defibrillator will enter "SYNC" mode and the synchronising circuit within the defibrillator will detect the patient's R-waves. When the shock button is pressed and held, the unit discharges with the next detected R-wave, thus avoiding the vulnerable T-wave segment of the cardiac cycle.	Non synchronous The shock may fall randomly anywhere within the cardiac cycle (QRS complex). Unsynchronized cardioversion (defibrillation) is used when there is no coordinated intrinsic electrical activity in the heart (pulseless VT/VF) or the defibrillator fails to synchronize in an unstable patient.
ENERGY LEVEL	Starts at 25J – 120 J	Highest energy as per manufactured recommendation 120J-200J
INDICATIONS	Tachyarrhythmias causing hemodynamic compromise 1. Ventricular Tachycardia with pulse 2. Supraventricular Tachycardia 3. Atrial Flutter	1. Ventricular Fibrillation 2. Pulseless Ventricular Tachycardia

	<p>4. Atrial Fibrillation 5. Atrial Tachycardia 6. Junctional Tachycardia</p>	
NEED FOR PROCEDURAL SEDATION	Patient needs Sedation because patient is conscious.	Patient does not need sedation because patient is Unconscious.
PRACTICAL PROCEDURE	<ul style="list-style-type: none"> • Check the availability of full Resuscitation Equipments and Drugs • Secure IV access • Connect ECG Monitoring and Pulse Oximetry • Sedate with Midazolam and Fentanyl • Pre-oxygenation • ENSURE SYNCHRONISATION is ON and marker on "R wave" • Select Energy Level – 25 -120 • Follow the steps as in page 39 	<ul style="list-style-type: none"> • Check the availability of full Resuscitation Equipments and Drugs • Secure IV access • Connect ECG Monitoring and Pulse Oximetry • ENSURE SYNCHRONISATION is OFF • Select Energy Level – High Joules (Highest as per manufacturer recommendation) • Follow the steps as in page 38

ENERGY AND CURRENT FLOW

Adequate current flow through the heart is required for successful defibrillation. The current delivered to the myocardium with a given energy is dependent on the "Transthoracic Impedance", which can vary widely among patients. Thus, the same energy dose can potentially deliver varying current to a patient. Additionally, the percentage of current shunted through the thorax, away from the myocardium, influences the net current a patient receives.

MONOPHASIC DEFIBRILLATORS

Electrical current flows in a single direction from an electrode on one side of the patient's chest to a second electrode on the other side. The waveform associated with monophasic defibrillations contains a Single peak. The highest part of the waveform, the peak current, is a key determinant of successful defibrillation. There must be enough current to reach the heart to defibrillate (terminate the lethal rhythm), but not so much peak current that the heart is damaged.

BIPHASIC DEFIBRILLATORS

Electricity is sent from one electrode to the other in the first phase of this waveform, followed by a return back to the originating electrode in the second phase. Biphasic technology requires a much lower current to achieve successful termination of fibrillation. This may result in less damage to the myocardium and a reduced frequency of postshock contractility and dysrhythmias.

PADDLE / PADS SIZE

- Larger Size associated with higher success rates and less Myocardial Damage
- Paddles/pads of 10–13 cm optimally reduce transthoracic impedance

METHOD OF USE

There are two accepted positions to optimize current delivery to the heart:

- **ANTEROAPICAL** – one pad/paddle is placed to the right of the sternum just below the clavicle, and the other is centred lateral to the normal cardiac apex in the anterior or midaxillary line (V5–6)
- **ANTEROPOSTERIOR** – the anterior pad/paddle is placed over the precordium or apex, and the posterior pad/paddle is placed on the back in the left or right infrascapular region.

ARRHYTHMIAS

Normal Sinus Rhythm
